

## Definition

Linear Functions	All terms are of degree 0 or 1. A solution of a system of linear equation is set of points that makes the equation system true.
Consistent	lin. systems is consistent if either 1 or $\infty$ solutions exist else inconsistent.
Conist	

## Linear Systems and Matrix Equations

### Coefficient Matrix Example

$$\begin{cases} A_1x_1 + A_2x_2 + A_3x_3 = \alpha \\ B_1x_1 + B_2x_2 + B_3x_3 = \beta \end{cases} \Leftrightarrow \begin{bmatrix} A_1 & A_2 & A_3 \\ B_1 & B_2 & B_3 \end{bmatrix} \quad (1)$$

### Augmented Matrix Example

$$\begin{cases} A_1x_1 + A_2x_2 + A_3x_3 = \alpha \\ B_1x_1 + B_2x_2 + B_3x_3 = \beta \end{cases} \Leftrightarrow \left[ \begin{array}{ccc|c} A_1 & A_2 & A_3 & \alpha \\ B_1 & B_2 & B_3 & \beta \end{array} \right] \quad (2)$$

## Row-Equivalence

Two matrce are row-equivalent if there is a sequence of **EROS** that transforms one into the other.

## Elementary Row Operations (EROS)

1. **[Replacement]** Replace one row by sum of itself.
2. **[Interchange]** Swap position of 2 rows.
3. **[Scaling]** Multiply all entries in row by non-zero constant.

## Echelon Form (ef)

1. All non-zero rows are above any rows of all-zero.
2. Each leading entry of a row is in a column to the right of the roe above it.
3. All entries in a column below a leading entry are 0.

## Reduced Row Echelon Form (rref)

1. As to be in echelon form.
2. Leading entry in each row is 1.
3. Each leading 1 is the only non-zero entry in its column.

## Theorems

**Theorem 1** Every matrix is row equivalent to a unique row echelon form.

**Theorem 2** Every matrix is row equivalent to a unique row echelon form.

## Matrix Algebra, Determinants, & Eigenvectors

## Orthogonality and Diagonalization

### Definition

Inner Product	$\vec{v} \cdot \vec{u} = \vec{v}^T \vec{u} = u_1v_1 + \dots + u_nv_n$ (Also called dot product or scalar product)
Length of $\vec{x}$	$  \vec{x}   = \sqrt{\vec{x} \cdot \vec{x}} = \sqrt{x_1^2 + \dots + x_n^2}$ (Also called Norm or Magnitude)
Unit vectore	A vector with $  \vec{x}   = 1$
Normalization	The formula $\vec{u} = \frac{\vec{x}}{  \vec{x}  }$ creat a unit vector in the same direction as $\vec{x}$ .

Distance  $dist(\vec{u}, \vec{v}) = \vec{u} - \vec{v}$    $dist(\vec{u}, \vec{v})$

Orthogonality	$\vec{u} \cdot \vec{v} = 0$ 
Orthogonal Set	A set of vectors $\{\vec{u}_1, \dots, \vec{u}_p\} \in \mathbb{R}^n$ such that each distinct vectors are orthogonal.
Orthogonal Basis	For a subspace $W$ of $\mathbb{R}^n$ is a basis that is also an orthogonal set.
Orthonormal set	is a set of orthogonal unit vectors.
Orthogonal matrix	Is a squared matrix whose columns are orthonormal.
Normal equation	$A^T A \vec{x} = A^T \vec{b}$
least-squares error	$  \vec{b} - A\hat{x}  $
Orthogonal Complements	Let $W$ be a subspace of $\mathbb{R}^n$ . The orthogonal complement of $W$ is: $W^\perp = \{\vec{x} \in \mathbb{R}^n   \vec{x} \cdot \vec{w} = 0, \forall \vec{w} \in W\}$
Orthogonal Projection	of $\vec{y} \in \mathbb{R}^n$ onto subspace $W$ of $\mathbb{R}^n$ is the vector $\hat{y}$ in $W$ such that $\vec{y} - \hat{y}$ is in $W^\perp$ . (Noted $\text{proj}_W(\vec{y})$ )
Least-Squares Problem	is to find $\vec{x}$ that makes $  \vec{b} - A\vec{x}   = \text{dist}(\vec{b}, A\vec{x})$ as small as possible.

## Theorems

**Properties 1** Let  $\vec{u}, \vec{v}, \vec{w} \in \mathbb{R}^n$  and  $c \in \mathbb{R}^n$  then:

- $\vec{u} \cdot \vec{v} = \vec{v} \cdot \vec{u}$  •  $(\vec{u} + \vec{v}) \cdot \vec{w} = \vec{u} \cdot \vec{w} + \vec{v} \cdot \vec{w}$  •  $(c\vec{u}) \cdot \vec{v} = c(\vec{u} \cdot \vec{v}) = (c\vec{v}) \cdot \vec{u}$
- $\vec{u} \cdot \vec{u} = u_1^2 + \dots + u_n^2 \geq 0$

**Theorem 3 (Fundamental Subspaces Theorem)** Let  $A_{M \times N}$  then: •  $(\text{row}(A))^\perp = \text{nul}(A)$  •  $(\text{Col}(A))^\perp = \text{nul}(A^\perp)$

**Theorem 4** If  $S = \{\vec{u}_1, \dots, \vec{u}_p\}$  is an **orthogonal set** of non-zero vectors in  $\mathbb{R}$  then  $S$  is a **linearly independant set**.

**Theorem 5** let  $\{\vec{u}_1, \dots, \vec{u}_p\}$  be an **orthogonal basis** for  $w \subset \mathbb{R}^n$ . Let  $y \in W$ . Then  $\vec{y} = C_1\vec{u}_1 + \dots + C_p\vec{u}_p$ ,  $C_j = \frac{\vec{y} \cdot \vec{u}_j}{\vec{u}_j \cdot \vec{u}_j}$

**Theorem 6** Let  $u = (\vec{u}_1\vec{u}_2\vec{u}_3)$ , where  $\{\vec{u}_1, \vec{u}_2, \vec{u}_3\}$  is orthonormal set.  $u^T \cdot u = I$

**Theorem 7** Let  $u$  be an **orthogonal matrix**, Let  $\vec{x}, \vec{y} \in \mathbb{R}$ :  
•  $|u\vec{x}| = |\vec{x}|$  •  $(u\vec{x}) \cdot (u\vec{y}) = \vec{x} \cdot \vec{y}$

**Theorem 8 (Orthogonal Decomposition Theorem)** Let  $W$  be a subspace with an orthogonal basis  $\{\vec{u}_1, \dots, \vec{u}_p\}$ . let  $\vec{y} \in \mathbb{R}^n$  then:  $\hat{y} = \left( \frac{\vec{y} \cdot \vec{u}_1}{\vec{u}_1 \cdot \vec{u}_1} \right) \vec{u}_1 + \dots + \left( \frac{\vec{y} \cdot \vec{u}_p}{\vec{u}_p \cdot \vec{u}_p} \right) \vec{u}_p$  

**Theorem 9 (Best Approximation Theorem)** Let  $W$  be a subspace of  $\mathbb{R}^n$ . Let  $\vec{y} \in \mathbb{R}^n$  and  $\hat{y} = \text{proj}_W(\vec{y})$ . Then  $\hat{y}$  is closest point to  $\vec{y}$  in  $W$ . That is  $\forall \vec{v} \in W, \vec{v} \neq \hat{y}, \|\vec{y} - \hat{y}\| < \|\vec{y} - \vec{v}\|$

**Theorem 10 (Orth. Proj. with Orthonormal Bases)** Let  $W$  subspace in  $\mathbb{R}^n$ . Let  $\{\vec{u}_1, \dots, \vec{u}_p\}$  be an orthonormal basis of  $W$ .  $\text{proj}_W(\vec{y}) = (\vec{y} \cdot \vec{u}_1)\vec{u}_1 + \dots + (\vec{y} \cdot \vec{u}_p)\vec{u}_p$  Let  $U = (\vec{u}_1 \ \vec{u}_2 \ \dots \ \vec{u}_p)$ . Then  $\text{proj}_W(\vec{y}) = UU^T \vec{y}$

**Theorem 11 (Normal Equations and Least-Squares Sol.)** The set of least squares solutions of  $A\vec{x} = \vec{b}$  coincide the non-empty solutions of the Normal equation.

## Fact about the Orthogonal Complements

- $\vec{0} \in W^\perp$  since  $\vec{0} \cdot \vec{w} = 0$
- If  $W \in W^\perp, c \in \mathbb{R}$  then  $cW \in W^\perp$

- If  $\vec{w}_1, \vec{w}_2 \in W^\perp$  so  $(\vec{w}_1 + \vec{w}_2) \cdot \vec{x} = \vec{w}_1 \cdot \vec{x} + \vec{w}_2 \cdot \vec{x} \in W$

## Gram-Schmit Process(G-S)

The Gram-Schmit Process is an algorithm producing an orthogonal basis.

Start with  $\{\vec{x}_1, \dots, \vec{x}_n\}$  basis for nonzero subspace  $W$  of  $\mathbb{R}^n$  define:

$$\vec{v}_1 = \vec{x}_1$$

$$\vec{v}_2 = \vec{x}_2 - \left( \frac{\vec{x}_2 \cdot \vec{v}_1}{\vec{v}_1 \cdot \vec{v}_1} \right) \vec{v}_1$$

$\vdots$

$$\vec{v}_n = \vec{x}_n - \left( \frac{\vec{x}_n \cdot \vec{v}_1}{\vec{v}_1 \cdot \vec{v}_1} \right) \vec{v}_1 - \dots - \left( \frac{\vec{x}_n \cdot \vec{v}_{n-1}}{\vec{v}_{n-1} \cdot \vec{v}_{n-1}} \right) \vec{v}_{n-1}$$
