# Boolean algebra

### Boolean Identity's

DeMorgan Laws  $\neg (a \lor b) \equiv \neg a \land \neg b$  $\neg(a \land b) \equiv \neg a \lor \neg b$  $\neg \forall x \ \beta(x) \equiv \exists x \ \neg \beta(x)$  $\neg \exists x \ \beta(x) \equiv \forall x \ \neg \beta(x)$ Distributivity  $a \wedge (b \vee c) \equiv (a \wedge b) \vee (a \wedge c)$ 

 $a \lor (b \land c) \equiv (a \lor b) \land (a \lor c)$ 

Elimination  $a \wedge T \equiv a$ 

 $a \wedge F \equiv F$  $a \vee F \equiv a$  $a \vee T \equiv T$ 

## Implications and equivalence Identity

### Proof

## Naive Set's Theory

#### **Definitions**

Union  $a \cup b = \{x \in U | x \in a \lor x \in b\}$ Intersection  $a \cap b = \{x \in U | x \in a \land x \in b\}$  $A - B = A \cap \overline{B} = \{x | x \in A \land x \notin B\}$ Difference  $A \times B = \{(a, b) | a \in A \land b \in B\}$ Cartesian Product  $A_1 \times ... \times A_n$  $= \{(a_1 \times ... \times a_n) | a_i \in A_i \text{ for } i = 1, ..., n\}$ 

 $\{a,b\} \times \{0,1\} = \{(a,0),(a,1),(b,0),(b,1)\}$ The power set  $\wp(E)$  is the set of all sub sets Theorem 1 For every set S,  $\emptyset \subseteq S$  and  $S \subseteq S$ .

Power Set

of E.

Intervals  $[a,b] = \{x | a \le x \le b\}$ 

 $(a,b) = \{x | a < x < b\}$ 

Proper subset  $A \subset B$ 

Subsets  $A \subseteq B = \forall x (x \in A \to x \in B)$ 

A disjoint B.  $A \cap B = \emptyset$ 

The sets A and B are equal if  $A \subseteq B$  and  $B \subseteq A$ .

Let S be a set. If there are exactly n distinct elements in Swhere n is a non negative integer, we say that S is a *finite* set and that n is the cardinality (|S|) of S.

#### Identities

Identity  $A \cap U = A$  $A \cup \emptyset = A$ Domination laws  $A \cup U = U$  $A \cap \emptyset = \emptyset$ Idempotent laws  $A \cap A = A$  $A \cup A = A$  $(\overline{A}) = A$ Complementation law Commutative law  $A \cap B = B \cap A$  $A \cup B = B \cup A$ 

### Modular Arithmetic

a is divisebla by ba congruent to b $b \equiv a \pmod{N}$  $a \equiv b \pmod{N}$ a congruent to b

# Counting

# Discrete Probability's

#### **Definition**

S is the a finite nonempty sample space of equally likely outcomes, and  $E \subseteq S$ , the probabilitie of E is  $p(E) = \frac{|E|}{|S|}$ .

### Some Probability Theorems

$$p(\overline{E}) = 1 - p(E)$$
  
 $p(E_1 \cup E_2) = p(E_1) + p(E_2) - p(E_1 \cap E_2)$ 

#### Theorems

**Theorem 2** Consider  $f: \mathbb{Z} \to \mathbb{R}$  and  $g: \mathbb{Z} \to \mathbb{R}$ 

We say f(x) is  $\mathcal{O}(g(x))$  if there exist constants C and k such that  $|f(x)| \le C|g(x)|$  whenever x > k.

 $=\forall x(x\in A\rightarrow x\in B)\wedge\exists x(x\in B\wedge x\notin A) \text{ Theorem 3 (Def modulo)} \ \ Let\ m\in\mathbb{Z}^+.\ \ a\equiv b(mod\ m) \ \ if\ and$ only if  $\exists k(a = b + km)$ . Where a and b are  $\mathbb{Z}$ 

Theorem 4 (Fermat little thm)  $a^{p-1} \equiv 1 \pmod{p}$ 

**Theorem 5** Let m be a positive integer. If  $a \equiv b \pmod{m}$  and  $c \equiv d \pmod{m}$ , then  $b + d \equiv b + d \pmod{m}$  and  $bd \equiv bd \pmod{m}$ .
