General Reminders

Class: CSCI 1300

#include "myfile.h" Include file. Random int, #include<cstdlib>. rand() int(var) Convert a data type var to int. Convert a data type var to float. float(var) double(var) Convert a data type var to double. static_cast<t>(var) Convert var to the type t. read only fonction. void myF() const inline the whole code of the inline function is inserted or substituted at the point of its call during the compilation. constexpt that specify that an expression must be evaluated at compile time. return the number of bytes used by the sizeof(var) variable. sizeof runs at compile-time. condition? ifTrue: ifFalse ternary Opearator

Strings

str[i] Get or set the char at the index i. str.length() Return the number of characters. Returns the substring from a to b. str.substr(a,b) Retrun the start index of the substring str.find(subStr) str.replace(i,l,str) Replace substring from i to 1 with str stoi(str) Convert a string to int, #include<string>. to_string(var) Convert var to a string, #include<string>.

Arrays

Vectors

#include<vector> Include vector library. vector<type> V; Instantiate a vector. Instantiate a vector from Array obj. vector<type> V(size); Instantiate a vector from Array. vector<type> $V{6,3,3}$; V=vector<type>(); Re-instantiate V. Returns the element at index i. V.at(i) V.size() Return the number of elements. V.push_back(Value) Add the new element at the end. V.pop_back() Remove the last element. V.clear() Empty the vector.

Insert Value at i.

Structures

V.insert(i, Value)

myStruct Obj; instantiate structure object.
Obj.param1 Access param1 of Obj.

Streams

#include<fstream> Include stream library. Include string stream library. #include<sstream> ifstream fin; Instantiate a input stream. ofstream fout; Instantiate a output stream. stringstream s(str); Instantiate a string stream. Open txt file whith the stream. myS.open("file.txt") myS.close() Close the stream file. getline(fin, line) Get the next line from fin. fout<<"hello" Output in stream "helloWorld". fin>>var Input from stream to var. Set decimal points, #include<iomanip>. <<setprecision(n)<< <<setw(n)<< Establishes a print field of n spaces. Display floating point numbers in fixed. <<fired<< point notation. Enables or disables the unconditional <<showpoint<< <<noshowpoint<< inclusion of the decimal point character in floating-point output. <<left<< output the string on the left. <<ri>t</ output the string on the right.

clear buffer

The buffer must be cleared after after getting an input from a stream if you input and output in the same file at the same time.

```
if(cin.fail() == true) {
   cout << "cin failed state";
   cin.clear();
   cin.ignore(1000, '\n');
}</pre>
```

cmath

Error Handling

```
try {
    // risky operation
} catch (exceptions) {
    // runs if an exception of type Ex is thrown
}
```

#include<cassert>
#include<stdexcept>
throw myException
exception::what()
catch (const auto& e)
catch(...)
exception

Include assert library.
Common standard exceptions.
Throw an error of type myException.
Retrieve diagnostic message.
Catch exceptions by const reference.
Fallback handler; rethrow if unsure.
Parent of all exceptions class.

Object Oriented Programing(OOP)

myClasses myObj(3,5);
myClasses myObj;
protected:

Instantiate an myClasses type obj. Call the default constructor. similar to private, but it can also be accessed in the inherited class.

OOP With header file

If you use a header the file wich contain the main function must include the header file.

Header file(myHeader.h)

```
#ifndef MYCLASS_H //if no def for MyClass
#define MYCLASS_H //else

using namespace std;

class MyClass{
   public:
      MyClass(); //default constructor
      MyClass(p1, p2); //parameterized constructor
      int publicAtribute;
      void myFunction() const;
   private:
      int privAtribute;
};
#endif
```

Class file(.cpp)

```
#include <iostream>
#include "myHeader.h"

MyClass::MyClass(){
    publicAtribute = 0;
    privAtribute = 0;
}

MyClass::MyClass(int p1, int p2){
    publicAtribute = p1;
    privAtribute = p2;
```

```
void MyClass::myFunction() const{
    // my code
}
```

Switch case

```
switch (x){
    case 0:
        /*Code in case 0*/
    break;
:
    case n:
        /*Code in case n*/
    break;
    default:
        /*Code if no case match*/
}
```

Pointer & References

Lambda Expression

```
... = [captureClause] (parameters) -> returnType {
// definition
}
```

[&] capture all external variables by reference.
[=] capture all external variables by value.
[a, &b] capture 'a' by value and 'b' by reference.

Important ASCII Conversions

ASCII	int								
A	65	a	97	N	78	n	110	0	48
В	66	b	98	О	79	О	111	1	49
C	67	c	99	P	80	р	112	2	50
D	68	d	100	Q	81	q	113	3	51
E	69	e	101	R	82	n	114	4	52
F	70	f	102	S	83	s	115	5	53
G	71	g	103	T	84	t	116	6	54
H	72	h	104	U	85	u	117	7	55
I	73	i	105	V	86	v	118	8	56
J	74	j j	106	W	87	w	119	9	57
K	75	k	107	X	88	x	120		
L	76	1	108	Y	89	у	121		
M	77	m	109	Z	90	z	123
