

Cargo Commands

Cargo is the default: package manager, builder for rust projects and version control via git. All of the following command should be preceded by **cargo**.

new new_p	Create a new project directory called new_p .
run	Build and run the project.
build	Build the project.
clean	Remove the target directory.
test	Run the tests.
update	Update dependencies.
doc	Build documentation for the project.

General Reminders

use module::submodule	Import a module or submodule.
println!("hello")	Print hello to the console.

Strings

String::new()	Create a new empty string.
String::from("s")	Create a new string with the value "s" .
{var}	Insert the value of var into the string.

Input/Output

For using input and output: the **std::io** module must be imported.

io::stdin()	Get a handle to the standard input.
io::stdout()	Get a handle to the standard output.

Basic syntax

Hello World

```
fn main() {  
    println!("Hello, world!");  
}
```

```
let mut s; // create a mutable variable s  
let s1; // create a constant string s1
```
